## G. Fiorenza topics

---

- At EU level, there are many different initiatives, at the same time aiming to set security requirements on the same products. Both vendors and utilities need a clear framework (requirements and assessment method) to provide and ask for secure products and services. Currently we have high chance to face competing frameworks leading to extra costs and confusion about how secure products are.
- Market access legislation (RED, CRA) and product certification can create a positive common security baseline, but stronger security requirements for products and services used in critical infrastructures should be defined by their operators who are responsible for the security risks.
